

## BENEFITS OF UTILIZING LARGE DIAMETER ROLLED AND WELDED PIPES

Many industrial processes require a high volume of liquids, including those involved in the oil and gas, mining and minerals, and chemical industries. When the process engineer determines a pipe diameter requirement larger than 24", a rolled and welded large diameter pipe is required.

Benefits of Utilizing Our Large Diameter Rolled and Welded Steel Pipes:

- Can be used for long-distance pipeline projects since they can carry more liquid with a high-volume flow rate
- Available in carbon steel and stainless steel
- Can be fabricated to any thickness, diameter, height, or length
- Steel pipe coating options are available to protect fabricated pipes from damage over time
- Can be used for a structural applications including bracing, casing, jack and boring installations, sign poles, and combination walls
- Capable of operating under extreme weather conditions
